

DTC 1000/2000 Temperature Controller

Instruction Sheet

Thank you very much for purchasing DELTA C Series Temperature Controller. Please read this instruction sheet before using your C series to ensure proper operation and please keep this instruction sheet handy for quick reference.

Caution

DANGER! Caution! Electric Shock!

DTC1000 is an OPEN-TYPE Process Control Equipment and DTC2000 is an OPEN-TYPE Process Control Accessory. These devices are microprocessor-based temperature regulating controllers which may be provided with normally closed and/or open contacts. They are intended for installation completely within an overall panel or Process control Enclosure and are used in heating or cooling applications. Please install within a separate UL Listed enclosure only, keep the enclosure away from airborne dust or high humidity and prevent electric shock or sudden shock. Also, it is equipped with protective methods such as some special tool or key to open the enclosure, so as to avoid the hazard to users or any damage to the module.

WARNING!

- Prevent dust or metallic debris from falling into the controller that will cause malfunction.
- Do NOT modify or disassemble the controller.
- Do NOT connect to "No Used" terminal.
- Do not install and/or use the controller in places subject to:
 - Dust or corrosive gases and liquid.
 - High humidity and high radiation.
 - Vibration and shock.
 - High voltage and high frequency
- Power off when wiring and changing an input sensor.
- Be sure to use compensating wires that match the thermocouple types when extending or connecting the thermocouple wires.
- Shorten the wire when wiring a platinum resistance thermometer (RTD) to the controller and separate power cable from load wires to prevent interference and conductive influence.
- Make sure power cables and signals device are installed properly before power on; otherwise serious damage may occur.
- Do NOT touch the terminals or repair the controller when power on to prevent electric shock.
- Wait at least one minute after power off to allow capacitors to discharge, and do not touch any internal circuit within this period.
- Do NOT touch internal terminals no matter power on or off.
- For temperature accuracy, keep the controller away from heating source.

Model Name Explanation

DTC 1 2 3 4 5

DTC Series	DTC: Delta C series Temperature Controller
1 Controller Position	1: first controller 2: controller in parallel
2 Auxiliary Output Groups	0: standard, 2 groups output, no auxiliary output 1: 1 group auxiliary output. Not available now. 2: 2 groups auxiliary output. Not available now.
3 4 Optional	00: standard 01: CT input. Not available now. 02: Event input. Not available now.
5 Main Output Type	R: Relay output SPST, 250VAC, 3A V: Voltage Pulse output 12V +10% ~ -20% C: Current output 4 ~ 20mA L: Linear Voltage output 0 ~ 10V

Standard: DC24V input, Relay output for 2nd group, RS-485 communication.

Function & Specification

Power supply	DC24V. Isolated switching power
Voltage range	Rated voltage: 90% ~ 110%
Power consumption	Rated 24 Vdc, Max. 24 W combined, 3 W + 3 W x no. of DTC-2000 (max. 7 connected)
Sensor type	Thermocouple: K, J, T, E, N, R, S, B, L, U, TXK Platinum RTD: Pt100, JPt100 Linear DC input: 0 ~ 5V, 0 ~ 10V, 0 ~ 20mA, 4 ~ 20mA, 0 ~ 50mV
Sampling rate	Analog input: 0.15 sec. Thermocouple or Platinum RTD: 0.4 sec.
Control method	PID, PID program control, Manual or ON/OFF
Output type	Relay output (SPST), Max. load 250VAC, 3A resistive load Voltage pulse output: DC 12V, Max. output current 40mA Current output: DC4 ~ 20m A output (Load resistance: Max. 500Ω) Analog voltage output: 0 ~ 10V (Load resistance shall be higher than 1000Ω)
Output function	Control output, Alarm output, or Retransmission output (only for linear voltage and current output as 1 st group)
Alarm function	12 Alarm mode selections
Communication	RS-485 digital communication, 2,400bps ~ 38,400bps.
Communication protocol	Mod-bus communication protocol, support RTU/ASCII.
Internal connection	Provide internal connection terminals to transmit 24V power supply and communication signal.
Vibration resistance	10 to 55Hz, 10m/s ² for 10min, each in X, Y and Z directions
Shock resistance	Max. 300m/s ² , 3 times in each 3 axes, 6 directions
Ambient temperature	0°C to + 50°C
Storage temperature	-20°C to +65°C
Altitude	2,000m or less
Relative humidity	35% to 85% RH (non-condensing)
Pollution degree	Degree 2

Product Profile & Outline

- DTC1000R/V/C/L**
- RUN/STOP switch
 - Wiring and Model name
 - DIN fix
 - I/O terminals
 - LED indicators
 - Extension hole of the extension unit mounting pins
 - Specification label
 - Extension port
 - Extension clip
 - DIN rail
 - RS-485 communication port
 - Extension clip
 - DC power input

 - Extension port
 - Extension clip
 - DIN rail
 - Extension port

Input Sensor Type

Input Selection for DTC series:

Input Sensor Type	Register Value	Available Range
0 ~ 50mV linear voltage input	17	0 ~ 50mV
4 ~ 20mA linear current input	16	4 ~ 20mA
0 ~ 20mA linear current input	15	0 ~ 20mA
0 ~ 10V linear voltage input	14	0 ~ 10V
0 ~ 5V linear voltage input	13	0 ~ 5V
Platinum RTD (Pt100)	12	-200 ~ 600°C (-328 ~ 1,112°F)
Platinum RTD (JPt100)	11	-20 ~ 400°C (-4 ~ 752°F)
Thermocouple TXK type	10	-200 ~ 800°C (-328 ~ 1472°F)
Thermocouple U type	9	-200 ~ 500°C (-328 ~ 932°F)
Thermocouple L type	8	-200 ~ 850°C (-328 ~ 1562°F)
Thermocouple B type	7	100 ~ 1,800°C (212 ~ 3,272°F)
Thermocouple S type	6	0 ~ 1,700°C (32 ~ 3,092°F)
Thermocouple R type	5	0 ~ 1,700°C (32 ~ 3,092°F)
Thermocouple N type	4	-200 ~ 1,300°C (-328 ~ 2,372°F)
Thermocouple E type	3	0 ~ 600°C (32 ~ 1,112°F)
Thermocouple T type	2	-200 ~ 400°C (-328 ~ 752°F)
Thermocouple J type	1	-100 ~ 1,200°C (-148 ~ 2,192°F)
Thermocouple K type	0	-200 ~ 1,300°C (-328 ~ 2,372°F)

Note 1: An internal 249Ω precision resistor for the current input is built-in, please refer to the item, How To Set Up Current Input.
Note 2: Factory setting: PT100 input. It is adjustable for linear input and feedback ranges. The default range of input feedback is -999 ~ 9,999. For example, when a 0 ~ 20mA analog input is selected as the input temperature sensor type, -999 indicates 0mA and 9,999 indicates 20mA. If change the input range to 0 ~ 2,000, then 0 indicates 0mA and 2,000 indicates 20mA. One display scale is equal to 0.01mA.

Output Function

Output control for DTC is selective: Control output (heating, cooling), Alarm output, or Retransmission output.

Control Output:

Temperature can individually be controlled by two groups of outputs: cooling (forward) or heating (reverse). When Dual Loop output control is used, two output controls shall be designed for cooling (forward) or heating (reverse). If two control outputs with the same direction are performed, only 1st group control period is valid. Control methods: PID control, ON/OFF control, Manual control, and PID program control.

Single-output Control:

Figure 1: ON-OFF control of single output

Figure 2: PID Control, forward (cooling) control

Figure 3: PID Control, reverse (heating) control

Dual Output Control:

Figure 5: PID control, Dead band is positive

Figure 6: PID control, Dead band is negative

Description of Function and Parameters Setting:

PID program control by 8 patterns (Pattern No. 0~7) is supported in DTB series. Each pattern contains 8 steps (step No. 0 ~ 7), one Link Pattern parameter, one Cycle parameter and one Actual Step parameter.

Start Pattern: P_{Start} is in operation mode and it is used to set the Start Pattern of PID program control (This parameter appear in P_{SEtP} mode only).

Steps: Include set point X and execution time T, these two parameters setting. The set point (SV) should reach temperature X after the period of execution time T. If the set point is the same as the result of the previous setting, then it is called Soak program control. If not, then it is called Ramp program control. Therefore, PID program control is also called Ramp/Soak program control.

The default of step No. 0 in this controller is Soak program control. The controller will control the temperature (PV) to reach the set point X and then keep the temperature at set point X. The period of execution time is time T which provided by step No. 0.

Link Pattern Parameter: For example, when set $L_{Pattern}$ to 2, it indicates that pattern No. 2 will execute next after the execution of pattern No. 0. If set to OFF , it indicates the program will stop after executing the current pattern and the temperature will keep at the set point of the last step.

Cycle Parameter: Additional execution cycle number. For example, when set C_{Cycle} to 2, it indicates that pattern No. 4 should execute twice in addition. Including the origin one time execution, the pattern executes totally three times.

Actual Step Parameter: Execution step number per pattern (can set to 0 ~ 7). For example, when set A_{Step} to 2, it indicates that pattern No 7 will not execute other steps than step 0 to step2.

Execution: When r_{-5} is set to r_{On} , the program will start to execute in order from the step 0 of start pattern.

When r_{-5} is set to r_{Stop} , the program will stop and the control output is disabled.

When r_{-5} is set to r_{SEtP} , the program will stop and the temperature at that time will be controlled at the set point before program stop. Select r_{On} again, then the program will restart and execute from step 0 of start pattern.

When r_{-5} is set to r_{Hold} , the program will hold and the temperature at that time will be controlled at the set point before program hold. Select r_{On} again, then the program will follow the step before hold and start to execute through the rest of the time.

Retransmission Output:

When the 1st group output of this controller is linear voltage or current output, it can be Retransmission that is the output variation corresponding with input. For example, when read value = 0 with input range 0 ~ 1,000, output will be 0mA or 0V. When read value = 1,000, output will be 20mA or 10V.

Figure 7: Retransmission

Alarm Output:

This controller provides twelve types of alarm input selections. When PV is higher or lower than SV, alarm output will act. Following table consists of twelve alarm output modes.

SV	Alarm Type	Alarm Output Function
0	No Alarm Function	Output is OFF
1	Deviation upper- and lower-limit:	This alarm output operates when PV value is higher than the setting value SV+ (AL-H) or lower than the setting value SV- (AL-L).
